Odoo Website Test Plan

Version 1.0 | Prepared by: QA Team (6 members) | Status: Draft for review

1. Context of Testing

1.1 Introduction

This plan describes how the QA team will test the Odoo website. The website has two sides: the **Customer Side** (public website, shop, registration, My Account, inquiries) and the **Employee Side** (back-office apps such as Sales, CRM, Inventory, and the website administration used by staff). The plan defines what we test, who tests it, how, and when we consider testing complete.

1.2 Scope

In scope

- Authentication & Portal: Sign in / Create account / My Account.
- Navigation & Layout: Header, Footer, Logo, Responsiveness.
- Example of the Functional Modules: Shop, Events, Blog, Help, Appointments, Jobs, Currency Exchange.

Out of scope

- Testing or modifying core Odoo framework underlying code (Odoo Core Architecture).
- Live payment gateway processing (testing is limited to staging/sandbox environments).
- High-volume load/stress testing beyond specified server capacity limits.
- Data Integration: Direct conversion of orders into Sales Orders & Inventory stock deduction; conversion of contact forms into CRM Opportunities.

1.3 Test Objectives

The primary objective of this project is to execute comprehensive functional, non-functional, and integration testing on the Odoo Website and its back-end modules. The goal is to ensure high reliability, optimal user experience (UI/UX), data integrity, and seamless real-time synchronization between the customer-facing front-end and Odoo's Back Office ERP applications (Sales, CRM, Inventory) on a single database.

1. Verify that all forms, interactive elements, menu links, and module workflows behave as specified.
2. Confirm real-time data consistency between customer actions and the Sales, CRM, and Inventory apps.
3. Validate authentication, role-based access control (RBAC), and session privacy.
4. Assess the smoothness of the user flows for checkout, registration, and inquiry submission.
5. Find defects early, report them clearly, and provide management with an objective view of product quality and release readiness.

1.4 Constraints

Area	Constraint
Team	Six testers; each tester has both manual and automation duties, so capacity is limited
Time	Fixed project deadline; automation must be developed in parallel with manual testing
Environment	A single shared test instance; data changes by one tester can affect others
Tools	Open-source tools preferred (Selenium or Playwright, Postman, Jira or equivalent)
Data	No production or real customer data may be used
Documentation	Requirements may be incomplete; tester knowledge of standard Odoo behavior is needed
Browsers and devices	Limited physical devices; browser tools will cover most viewports

1.5 Test Basis

- Business requirements and user stories for the Odoo website (both sides)

- Acceptance criteria attached to each user story
- Standard Odoo documentation for the Website, eCommerce, Sales, CRM, and Inventory apps
- Wireframes or UI mock-ups, where available
- Role and permission matrix (access rights per user group)
- Organizational test policy and coding or accessibility standards
- Defect history and lessons learned from previous projects

2. Stakeholders

2.1 Internal Team Roles and Allocation

The test lead role is assigned to Tester 1 as a proposal; change it if your team decides otherwise.

Coverage summary

Area	Manual Testing	Automation Testing
Employee side	Testers 1, 2, 3, 4	Testers 3, 4
Customer side	Testers 5, 6	Testers 1, 2, 5, 6

2.2 Responsibilities by Role

Stakeholder	Role	Responsibilities
Test Lead (Tester 1)	Plan owner	Maintains this plan, assigns work, tracks progress and risks, reports status, controls entry and exit decisions
Testers (all)	Test execution	Analyze requirements, design and execute test cases, log defects with evidence, retest fixes, maintain test data
Automation testers	Automation	Select the framework, build and maintain scripts, run regression suites, report results

3. Communication

3.1 Forms and Frequency

Communication	Form	Frequency	Participants
Daily stand-up	15-minute meeting or chat	Daily	All testers
Sprint or cycle review	Meeting with demo	End of each cycle	Whole team and stakeholders
Final test summary	Report and presentation	End of project	All stakeholders

3.2 Tools and Channels

- Team chat and video meetings (Zoom and Google Meet) for daily communication
- Issue tracker (Jira) for defects, with a defined workflow: New, Assigned, In Progress, Fixed, Retest, Closed, Reopened
- Shared drive or repository for test cases, plans, and reports
- Version control (Git) for automation scripts, with pull-request review

3.3 Documentation Templates

The team will use standard templates for the following, stored in a shared folder:

- Test plan (this document)
- User story and acceptance criteria sheet
- Test case template: ID, title, module, side, priority, preconditions, steps, test data, expected result, actual result, status, tester, date, linked requirement
- SIQ (Software Inspection and Quality) checklist template, see section 5.4
- Requirements Traceability Matrix (RTM)

- Bug report template: ID, title, environment and browser, steps to reproduce, expected and actual result, severity, priority, screenshots or video, status, reporter, assignee
- Test summary report

4. Risks & Mitigation Plan

Identified Risk	Impact	Mitigation Strategy
Staging Environment Delay	High	Set up a local Odoo test instance to begin front-end UI test execution early.
Data Sync Failures between Front/Back Office	High	Perform dedicated end-to-end integration test passes and monitor Odoo server logs.
Scope Changes during Testing	Medium	Apply formal change management and adjust test schedules accordingly.
Unresponsive UI on Specific Viewports	Medium	Utilize automated cross-browser tools (e.g., BrowserStack) to detect device layout issues early.

5. Test Approach

5.1 Test Levels

Level	Description	Responsible
Integration	Interaction between the website and back-office apps (Sales, CRM, Inventory) and between customer and employee sides	Testers 1, 2, 3, 4 with Testers 5, 6 providing the front-end actions
System	Complete end-to-end scenarios across both sides in the full test environment	All testers
Acceptance	Validation against user stories and business needs, with the Product Owner	Test Lead with Product Owner

5.2 Test Types

Test Type	Scope and Description	Customer Side Focus	Employee Side Focus	Lead
Functional Testing	Verification of all form submissions, interactive elements, menu links, and module workflows	Registration, login, search, cart, checkout, contact forms, links	Quotations, orders, CRM stages, inventory operations, website admin	Testers 5 and 3
Integration Testing	Verification of real-time data sync between front-end actions and back-office apps (Sales, CRM, Inventory)	Place order, submit inquiry, update profile	Confirm the order appears in Sales, stock is reduced, the lead appears in CRM	Tester 2
UI/UX and Responsiveness	Layout and visual alignment checks across mobile, tablet, and desktop viewports across major browsers	All public pages and My Account	Main back-office screens used by staff	Tester 5
Security Testing	Role-based access control (RBAC), authentication checks, and user session privacy in My Account	Login, password rules, session timeout, access to other users data	Role permissions, restricted menus, direct URL access	Tester 4
Usability Testing	Assessing user flow smoothness during checkout, registration, and inquiry submissions	Checkout, registration, inquiry flows	Daily employee workflows, if time allows	Tester 6

Browser and viewport matrix

Dimension	Coverage
Browsers	Chrome, Edge (latest stable versions)
Mobile	375x667 and 414x896 (Android and iOS emulation, plus real devices where available)

5.3 Test Techniques

- **Equivalence partitioning and boundary value analysis** for form fields, quantities, prices, and dates
- **State transition testing** for order status, lead stages, and delivery states
- **Error guessing and exploratory testing** (time-boxed sessions) for unexpected behaviors
- **Checklist-based testing** for UI consistency and security basics (OWASP Top 10 awareness)

5.4 Test Deliverables

Deliverable	Description	Owner	When
User stories review	Review of user stories and acceptance criteria for testability; gaps logged as questions	Test Lead, all testers	Start of project
Test cases	Manual cases per module and side, written to the test case template, reviewed by a peer	Each tester for own area	Before each cycle
SIQ	Software inspection and quality checklists covering requirement reviews, test case reviews, and code or script reviews with recorded findings	Test Lead	Before test design and before execution
Traceability	Requirements Traceability Matrix linking user stories to test cases, automated scripts, and defects, so coverage gaps are visible	Tester 2	Updated weekly
Automation scripts	Customer-side and employee-side regression suites in version control, with execution reports	Automation testers	Incremental, per sprint
Test data sets	Documented users, roles, products, and orders	Testers 3, 4, 5	Before execution
Bug reports	Defects logged in the tracker using the bug report template	Reporter	During execution
Status reports	Weekly progress, defect, and risk summary	Test Lead	Weekly
Test summary report	Final results, coverage, open defects, metrics, risks, and release recommendation	Test Lead	End of project

5.5 Automation Strategy

- **Employee side:** Testers 3 and 4 automate stable, high-value flows: login and roles, quotation to sales order, lead creation and stage change, and stock movement checks.
- **Customer side:** Testers 1, 2, 5, and 6 share the work. Suggested split: Tester 1 (login, registration, My Account), Tester 2 (cart and checkout), Tester 5 (navigation, forms, responsive checks), Tester 6 (search, inquiry flows, shared utilities and reporting). The team can adjust this split.
- Use one agreed framework (for example Selenium or Playwright) with the Page Object Model and a shared repository.

5.6 Entry and Exit Criteria

Entry criteria

- Test plan approved and test scope agreed
- User stories and acceptance criteria available and reviewed
- Test environment deployed, stable, and accessible to all testers
- Test accounts, roles, and test data prepared
- Test cases designed and peer-reviewed for the planned cycle
- Build delivered with release notes and passing the smoke test
- Defect tracker and tools set up

Exit criteria

- All high priority test cases are executed.
- Closure of all Blocker and Critical severity defects.
- Overall test pass rate reaches at least 95%.
- Final test execution summary report is generated and signed off by QA.

5.7 Test Environment Requirements

- Dedicated Odoo test instance (website and back-office apps installed, same version and configuration as production, if possible)
- Separate accounts and database backups; email sending set to a catch-all or test mailbox
- Browsers: latest stable Chrome and Edge, plus some real mobile devices
- Tools: issue tracker, test management sheet or tool, Selenium or Playwright, Postman for API checks, browser developer tools, a CI job or scheduled runner for regression
- Access: VPN or network access, credentials, and permissions confirmed before the first cycle

5.8 Indicative Schedule

Phase	Activities	Duration
1. Planning and analysis	Plan approval, requirements review, SIQ, risk review, environment readiness	Week 1
2. Test design	Manual test cases, test data, traceability matrix, automation framework setup	3 weeks
3. Execution cycle 1	Smoke, functional and integration testing, first automation scripts	3 weeks
4. Execution cycle 2	Retest, UI/UX, security, and usability testing, extended automation	3 weeks
